🧭 WorkloadIQ

AI agent for Infosys-style delivery units: why are hours rising while productivity falls? (Synthetic illustrative data – not real Infosys figures.)

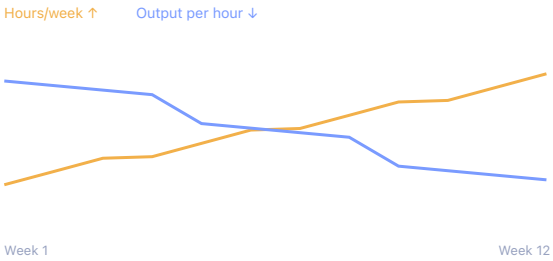

Avg weekly hours
45.6 h

Avg overtime
6.5 h

Avg absenteeism
5.2%

Teams at high risk
3 of 8

Company trend: hours vs. output per hour (12 weeks)

Correlation (hours vs. output/hour): **-0.98** – strong diminishing returns: extra hours are not producing extra output.

Agent: ask

Who is at risk? | Top bottleneck | Action plan

Select a question. The agent reasons over the scores computed below.

Team analysis (click a row)

Team	Hours	OT	Absent	Done%	Engage	WPI	OE	Burnout	Bottlene
Banking Platform	50	11	7.5%	68	4.6	100	0	93	Overloac
Insurance QA	48	9	6%	72	4.9	80	16	75	Overloac
Telecom Support Ops	46	6	8.8%	71	5	40	12	72	Disengag
Retail Cloud									

Migration	47	8	5.5%	74	5.8	66	30	58	Overload
Digital Experience	42	3	4.1%	80	5.1	0	43	31	Disengag
Data Engineering	44	5	3.8%	84	7	27	77	22	Healthy
Cybersecurity	45	6	3%	88	7.8	38	100	15	Healthy
Healthcare Analytics	43	4	3.2%	86	7.4	15	87	11	Healthy

Banking Platform – Overload

Workload pressure	**100/100**
Output efficiency	**0/100**
Burnout risk	**93/100**

Recommended interventions

- Cap overtime at 4 h/week
- Freeze new scope until backlog drops
- Add 2–3 contractors for peak sprints
- Weekly workload review with the delivery manager

What-if: workload intervention

Cut overtime by **25%** and rebalance tasks for **Banking Platform**

	Now	After
Overtime	11 h	8.3 h
Weekly hours	50 h	47.8 h
Output efficiency	0	8
Burnout risk	93	85

Estimates from the agent's rule-based gain model, not a guarantee.

Algorithm used by the agent

1. **Ingest** weekly HR + project data per team: hours, overtime, absenteeism, tasks assigned/completed, engagement (1–10), performance (1–5).
2. **Normalize** each metric to 0–100 using min–max across teams.
3. **Workload Pressure Index** `WPI = 0.35·hours + 0.35·overtime + 0.30·tasks per head` .
4. **Output Efficiency** `OE = 0.45·completion + 0.30·performance + 0.25·engagement` .

5. **Burnout Risk** `BR = 0.4·WPI + 0.3·(100−engagement) + 0.3·absenteeism` .
6. **Productivity per hour** `PPH = completion ÷ hours` ; compute Pearson correlation of hours vs. PPH over time (negative = diminishing returns).
7. **Bottleneck classification**: overload (WPI high, OE low), under-capacity (tasks/head high, hours moderate), disengagement (engagement low, workload normal), attendance strain (absenteeism high), healthy otherwise.
8. **Recommend** interventions from a rule library, rank by BR, and simulate impact with a regression-style gain: each 10% overtime cut recovers ≈ 3% OE for overloaded teams.
